

The Standard of Excellence in Tubular Welding Electrodes

Select-Arc Expands, Opens Troy Facility

Select-Arc, Inc. has purchased the former RevWires building and is establishing its Troy, Ohio operations there. The plant, located at 2015 West Stanfield Road, encompasses 79,400 square feet and will be utilized for manufacturing and support functions in conjunction with the Select-Arc headquarters based in Fort Loramie, OH. The plant commenced operations in October and plans to augment its production capabilities in the future.

The primary reason for the necessity to enlarge Select-Arc's plant operations was the rapid advancement in the number of premium, high quality welding electrode products offered to its extended customer base. The company produces a complete line of flux cored and metal cored welding wires including carbon steel, low alloy, stainless steel, nickel alloy and hardsurfacing electrodes. Select-Arc President Dale Stager emphasized that the determining factor in securing the Troy site was the need "to better serve our customers to meet their growing electrode product and service requirements".

Since its inception in 1996, Select-Arc has been dedicated to setting "The Standard of Excellence in Tubular Welding Electrodes".
