

Select 80C-D2

Low Alloy / Gas Shielded / Metal Cored

PRODUCT DATA SHEET

FEATURES

- Intended for welding of certain high strength, low alloy steels where a minimum tensile strength of 90 ksi is required in the deposited metal.
- Can be used to substitute ER80S-D2 or ER90S-D2 solid wire.
- Ideal for applications requiring weld metal which matches the mechanical properties of HSLA pressure vessel steels such as ASTM A302 Grade B, HSLA steels, and manganese-molybdenum castings such as ASTM A49, A291, and A735.
- Offers many advantages over solid wires including less sensitivity to subsurface porosity, elimination of lack of fusion or "cold lap", and 30-50% faster travels speeds for a given weldment size.
- The recommended shielding gas is 75%Ar/balance CO₂, as higher argon blends increase the strength of the weld deposit.

* WFS = Wire Feed Speed, CTWD = Contact Tip To Work Distance

**The parameters listed are recommended starting points of operation and the ranges for amperage, wfs, and voltage could be extended based on fitness for application. For products with "all-position" capability, as determined and listed in classification, the position recommendation can be determined based on operator skill and material thickness and isn't limited to the listing.

Welding parameters are for 75% Ar /25% CO2, at higher levels of argon the voltage should be gradually decreased: 1-2 volts for 98% Ar/2% O2.
